

Rodrigo Lopes Rincon

Software Engineer living in Brazil

✉ rodrigolr.15@hotmail.com
🌐 github.com/rodrigorincon

Always attentive to code quality and good practices. Lover of agile development.

Academic Background

2009–2015 **Bachelor's Degree**, Software Engineering by University of Brasília (UnB)

2010–2013 **Technical Degree**, Computer Graphics course by the School of Art, Game and Animation (SAGA)

Professional Experiences

Feb. **Tech lead**, Oto.Live

2025–Today I work with the CEO to define the event gamification system and transform decisions into business rules, requirements, and align needs with technical time. I did the POC and managed the development of new versions. I'm responsible for defining functional and non-functional requirements, infrastructure, improving scalability and work with development, QA and design teams writing documentation in English for them and developing crucial parts of the backend. As the technical team is spread around the world I'm responsible to manage them and keep updated all documentation for the team to work asynchronously. I also migrated the whole infrastructure from Heroku to AWS and use their solutions to scale and Build an AI solution to recognize different kind of objects and places in the events using AWS Rekognition and ChatGPT and implement liveness solution.

With this project the client events had a new channel to interact with the public and get insights about their interest and sponsors gained leads and measure the impact of their actions inside the event. I improved my soft and hard skills and English skills to manage an international team and when dealing with highly volatile environments, in addition I acted as operational manager during big events.

Main technologies used:

- Ruby on Rails, RSpec and Rubocop, AWS, AWS Rekognition and ChatGPT API, AWS Liveness, Microservices with AWS Lambda, Typescript and NextJs, Kanban, PostgreSQL and Redis, Docker, Git and Swagger

Main challenges:

- Lead a tech team spread in three different countries with all communication in English;
- Build an liveness and AI solution to recognize different kind of objects and places;
- Managing the operational team during major festivals;
- Migrate the whole infrastructure to a AWS;

Sep. **Backend Developer**, GoDaddy

2022–Jul. I worked in an American company with a diverse team spread by many countries and
2025 all communication in English. I built new features in the internal marketplace system, creating new functionalities and updating the already existing integrations with other marketplaces platforms. I also worked alongside the support team, investigating reported bugs and fixing them and keeping the high coverage test. I migrated some parts to serverless functions in Typescript, creating and updating these functions and their pipelines. All these improvements have made the system more robust and kept it constantly up to date with the ongoing changes in the systems with which it communicates.

I had the great experience to work in a international company and in a world spread team and have direct contact with clients around the world, what allowed me to develop better both hard and soft skills.

Main technologies used:

- Ruby on Rails, RSpec and Rubocop, AWS, Typescript, Microservices with AWS Lambda, Scrum, PostgreSQL, Redis and DynamoDB, Docker, Git, Swagger, Confluence and Github Pages, Honeybadger and Mixpanel

Main challenges:

- Work with an international team with all communication in English;
- Figure out and fix bugs related during the on-call rotation;
- Update many API integrations with REST, Soap and GraphQL;
- Create and update AWS lambdas and their pipelines and their integrations with main project;

Feb. **Fullstack Developer**, Sólides

2022–Sep. Maintenance, fixing bugs and building new solutions in the own HR and recruiting
2022 system. I refactor the components and endpoints that constantly cause bugs and I did the documentation for most of the system. The system became more comprehensive and robust with these improvements, meeting the directors' expectations. I had the opportunity to work with multidisciplinary teams and with different project management styles.

Main technologies used:

- Ruby on Rails, React, Kanban and Scrum, PostgreSQL, Docker, Git, Swagger, Wiki and Confluence, Rubocop

Main challenges:

- Document almost the whole system;
- List the known bugs and prioritize them by severity;
- Fix bugs and create automated tests for the worked parts;

- Jul. **FullStack Developer**, Epy
- 2020–Mar. I worked as a fullstack developer, using Ruby on Rails and React and the PWA
- 2022 in the fronted in a food delivery and bar and restaurants service. I worked in all development phases, since the conception of new features, design and development. I did integration with many systems, including payment platforms. I migrated the Rails server to a completely new microservice architecture made with AWS Lambdas. With all these improvements the clients could serve your customers better and more safely. I was also responsible for mentoring the startup trainees and helping them in their development.
- Main technologies used:
- Ruby on Rails, Javascript and Typescript, React, PWA, Web sockets, AWS, Microservices with AWS Lambda, Scrum, PostgreSQL, Docker, Git, Sentry
- Main challenges:
- Mentoring trainees and supervise them;
 - Migration to serverless structure;
 - Real time communication between many different platforms;
 - Ensure safety in sensitive integrations;
- Apr. **FullStack Developer**, Ownee
- 2019–Dec. I acted as tech leader, alongside the CTO deciding on the technical issues. I refactored
- 2019 the core of the system, designing and developing new modules or rebuilding old ones from scratch. I optimized the queries to speed up the requests and worked on the scalability of the system as a whole. I acted as a mentor of the interns, helping them in their tasks and in their growth with the used tools. With this project I could create mentoring skills and become the construction sites more organized, with the various parties able to communicate more effectively with one another.
- Main technologies used:
- Ruby on Rails and RSpec, Scrum, Javascript, Vuejs, PostgreSQL, Docker, Git, New Relic, Wiki and AWS
- Main challenges:
- Refactor the core of the system and maintain both different versions;
 - Plan and act the migration of each module for new version ;
 - Identify and resolve performance bottlenecks in API endpoints;
 - Mentor and supervise interns;

- Dec. **FullStack developer**, AIS Digital
- 2016–Apr. I worked as a Ruby on Rails developer, developing and maintaining highly complex software in several areas. Implemented tests, refactoring and implemented code analysis and CI/CD tools to increase the robustness of the developed systems. Some challenges were to maintain and evolve legacy projects, create new apps from scratch for bank managers and do workshops about test and Ruby. I worked allocated in the client and in international projects, in direct contact with the client. These systems enabled businesses to expand their plans and grow in their respective areas and allowed me to work with new technologies and multidisciplinary teams, taking my learning to the next level.
- 2019 Main technologies used:
- Ruby on Rails, NodeJS and Javascript, Scrum and Kanban, Backbone JS, Vuejs, RSpec, Capistrano and Jest, MySQL and PostgreSQL, Docker, Git and SVN, Bitbucket Pipeline, New Relic and Sentry, SonarQube and Rubocop, Swagger, Wiki and Confluence, AWS and Jelastic
- Main challenges:
- Create new complex projects from the scratch that deals with sensitive data;
 - Plan and do workshops for another developers;
 - Maintain legacy projects;
 - Work in international projects in direct contact with the client;
 - Work in many kind of different projects and contexts in a small period;
- Apr. **FullStack developer**, Preditiva
- 2016–Dec. I worked as web developer, implementing new features for a temperature monitor system for products sensitive to fluctuations, dispatching alarms when they entered a warning range. These features enable us to take preventive action and avoid product loss. I did solutions for CI/CD and IOT to real time communication with the hardware installed on the clients. I also developed solutions in NodeJS and several landing pages for A/B testing with HTML5 and CSS3. This experience allowed me to delve deeper into the areas of IoT, real-time systems, and CI/CD.
- 2016 Main technologies used:
- Ruby on Rails, Javascript, Scrum, Bootstrap, Nodejs, SemaphoreCI, MySQL, Git, Google Analytics and Google Ads
- Main challenges:
- Work with IoT devices;
 - Implement middleware to process IoT communication;
 - Implement CI/CD pipeline;
 - Monitoring access and performance by Google Analytics and heatmap tools;
 - Create many landing pages;
 - Implement A/B tests;

- Jul. **Co-founder**, Coremaster
- 2015–Dec. Co-founder of a small-scale company focused on the development of institutional websites and the structuring and security of computer networks. I worked mainly building sites with HTML5/CSS3 and Wordpress, including a online store for a small physical store, and apply SEO techniques for businesses to connect with their customers. We helped local and small business to enter in the Internet and start to connect with their customers online. I left the company due to disagreements about the business vision with the founder.
- 2015 Main technologies used:
- HTML5 and CSS3, Javascript, JQuery, Bootstrap, Wordpress
- Main challenges:
- Implement SEO techniques;
 - Create landing pages and institutional sites;
 - Create simple e-commerce with Wordpress;
- Sep. **Internship**, Bank of Brazil
- 2013–Jul. I worked with Java development evolving the system used by agencies outside the country. I worked refactoring the controllers following Clean Code principles, improving code maintainability, readability, and scalability. Furthermore I started the development of a RESTFull API Java system for access data by subsidiary companies. This experience strengthened my skills in Java web technologies and writing maintainable and scalable code in a professional project environment.
- 2014 Main technologies used:
- Java, Tomcat, JSF, framework FreeMarker, PostgreSQL, SVN
- Main challenges:
- Maintain legacy software;
 - Test software and ensure quality;
 - Investigate Proxy and security access to allow outside access to a new system in the bank;

--- Presentations

- I did a workshop about algorithms and how to think solutions as a programming developer at Latin American Open Source Software Instalation Fair (FLISoL 2023), the biggest event for spreading open source in latin America, and at Campus Party 2023, focused on elementary school children;
- I did a workshop about the first steps with Javascript at Campus Party 2022, teaching basic concepts about programming using Javascript for teenagers and adults;
- I did some workshops and speeches in Epy company for the trainees during 2021 and 2022, teaching about good pratics, clean code, API integrations and specific components of the system;
- I did a workshop and speech about automated tests with RSpec in AIS Digital company in 2018, talking about what and how to test, the types of tests and how to write a test with RSpec in a Ruby on Rails project;
- I taught about basic concepts of programming for high school students through robotics in the Edubot project at University of Brasília in 2016, using an educational kit made from Arduino;
- I presented at the Science and Technology Meeting in University of Brasília (ECT 2011) a project of food re-education software for Android system with a prototype demonstration;

- I did a speech and had an article accepted at the Science and Technology Meeting in University of Brasília (ECT 2011) regarding a project of continued training and appropriate technologies for digital inclusion of disabled and elderly people;

Projects

- I participated in the Labkids organization during 2022 and 2023, teaching basic concepts about programming for children through robotics, using an educational kit made from Arduino;
- I participated in the Edubot project at University of Brasília in 2016, teaching basic concepts about programming to high school students through robotics, using an educational kit made from Arduino;
- I participated in the development of the Adobe Reader plugin for digital signatures validation in PAdES standards of ICP-Brasil at University of Brasília from 2015 to 2016, using OpenSSL and C++ language;
- I participated in the project "Solidarity Carpool" at the University of Brasília from 2013 to 2014, as Java and PHP programmer and responsible for the modeling and implementation of the database;
- I participated in a development project in University of Brasília in 2012, in the database and Java development area;
- I participated in the research project Casa Brasil of Adapte (Association for Supporting People with Disabilities) by University of Brasilia in 2011, in the area of digital inclusion of disabled and elderly people;

Courses

- Linux Basic - University of Brasília – UnB (2009)
- HTML for Engineering - University of Brasília – UnB (2010)
- Adobe Photoshop CS4 - SAGA (2010)
- Adobe Illustrator CS5 - SAGA (2010)
- Adobe Dreamweaver CS5 - SAGA (2011)
- Network Foundations - CIEE (2008), Bradesco Foundation (2012)
- Information Security - Bradesco Foundation (2012)
- Analysis Structured of Systems - Bradesco Foundation (2012)
- Data Modeling - Bradesco Foundation (2012)
- Software Development Process - Bradesco Foundation (2012)
- Requirements Engineering - Bradesco Foundation (2012)
- Vue.js Essentials - Udemy (2017)
- Machine Learning and Data Science with Python - Udemy (2017)
- Architect SaaS Applications - Unique Challenges and Solutions - Udemy (2018)
- Introduction to Data Science Using Python - Udemy (2018)
- Learn Data Analysis using Pandas and Python - Udemy (2018)
- Data Science: Data Visualization with Python - Udemy (2018)
- Database design: Starting with NoSQL - Alura (2020)
- Continuous Integration: More quality and less risk to development - Alura (2020)
- Amazon Lightsail: simplifying the cloud - Alura (2020)
- Amazon EC2: High disponibility and scalability in an application - Alura (2020)
- Amazon CloudWatch: Complete visibility of cloud applications and services - Alura (2020)

- Amazon S3: Handle and store objects in the cloud - Alura (2021)
- Amazon Cloud Front and Route53: Distribute your files and create your own domain - Alura (2021)
- Amazon VPC: Providing a private cloud - Alura (2021)
- Amazon ECS: Manager Docker in AWS cloud - Alura (2021)
- Amazon Elastic Beanstalk - ALura (2021)
- SQL vs NoSQL - Motivations for use of each technology - Udemy (2021)
- Amazon Cognito: authentication as a service - Alura (2021)
- Agile fundamentals, steps to agile transformation - Alura (2022)
- Kanban, essential fundamentals - Alura (2022)
- Scalable web systems - FullCycle (2023)
- Code of Business Conduct and Ethics - Godaddy (2023)
- OWASP: Secure Coding - Godaddy (2024)
- Data Protection and Security Awareness - Godaddy (2024)
- Statistical Analysis - Unopar (2026)
- Data Scientist Complete Course - Udemy (2026)

Languages

Portuguese Native
English Fluent

Technical Expertises

Specialties

Languages

Java, Javascript, Typescript, Ruby

Web Technologies

HTML, JQuery, API building, Ruby on Rails, React, AWS

Databases

MySQL, PostgreSQL, Redis, MongoDB

Methodologies and Practices

Scrum, Kanban, XP

Development Supporting Tools

Git, UML, Docker

Testing Tools

Junit, Rspec, Cucumber, Jasmine, Jest

Knowledge Areas: development

Software Architecture, Framework Development, Design Patterns

Operational Systems

Debian, Windows

Solid Knowledge

Languages

Python, Go, PHP, C, C++

Web Technologies

Java web, Angular, CSS, Nodejs, Backbonejs, Vuejs

Methodologies and Practices

RUP, PMBOK

Development Supporting Tools

Rubocop, Sentry, Swagger, ScikitLearn, SVN, Capistrano, SonarQube, Vagrant

Knowledge Areas: development

Data Science, Machine Learning, Microservices, PWA, Real time processing, Digital Certificates and Signatures, Symmetric and Asymmetric Cryptography

Knowledge Areas: process

Measurement and estimation of costs and deadlines (including function point analysis)
